

Environmental Product Declaration

as per ISO 14025 and EN 15804

Owner of the declaration:	SIA BYKO-LAT
Publisher:	Kiwa BCS Öko-Garantie GmbH - Ecobility Experts
Programme holder:	Kiwa BCS Öko-Garantie GmbH - Ecobility Experts
Declaration number:	EPD-BYKO-LAT-128-EN
Issue date:	04.05.2021
Valid to:	03.05.2026

**Balcony doors and entrance doors
/ block doors outward / inward
opened 75 mm sash
(BYKO – DA75)**

1. General information

SIA BYKO-LAT

Programme holder

Kiwa BCS Öko-Garantie GmbH
- Ecobility Experts
Marientorbogen 3-5
90402 Nürnberg
Germany

Declaration number

EPD-BYKO-LAT-128-EN

This declaration is based on the Product**Category Rules**

Product category rules for windows and pedestrian doorsets (EN 17213)

Issue date

04.05.2021

Valid to

03.05.2026

Frank Huppertz
(President of Kiwa BCS Öko-Garantie GmbH – Ecobility Experts GmbH)

Prof. Dr. Frank Heimbecher
(Chairman of the independent expert committee BCS Öko-Garantie GmbH – Ecobility Experts GmbH)

BYKO – DA75

Owner of the declaration

SIA BYKO-LAT
Lāčplēša iela 75-5/6
Rīga, LV-1011
Latvia

Declared product / declared unit

1 m² of product

Scope

“Balcony door and entrance door / block door, outward / inward opened, 75 mm sash” (BYKO-DA75) triple-glazed and has a thermal transmittance of 1,0 W/(m²*K). The dimensions (height x width) are made according to the customer's requirements. The calculation based on the assumption of The LCA results are scalable for the desired door dimension. The product is manufactured in Valmiera, Latvia, and marketed internationally. Kiwa BCS Öko-Garantie GmbH – Ecobility Experts shall not be liable with respect to manufacturer information, life cycle assessment data and evidences.

Verification

The European standard EN15804:2020-03 serves as the core PCR

Independent verification of the declaration and data according to ISO 14025:2011-10

internally

externally

Joanna Zhuravlova
(External verifier – Ecomatters B.V.)

2. Product

2.1 Product description

All hardware is screwed in the sashes and frames. Door can be side opened. The dimensions (height x width) are adapted according to customer requirements.

2.2 Application

The intended uses are in domestic and commercial locations.

2.3 Technical Data

For the description of the declared performances ((EU) No 305/2011) is used. The harmonized standard for windows and doors is EN 14351-1.

Characteristic	Value	Unit
Glass type	Flat glass, Triple glazing	-
Total weight*	48,7	kg
Thickness	75	mm
Glass surface*	0,58	m ²
Heat permeability, door (U _w -value) (EN 10077)	1,0	W/(m ² *K)
Safety equipment	n.a.	-
Sound insulation	n.a.	db
Air permeability (EN 1026)	n.a.	-
Water tightness (EN12208)	n.a.	-
Resistance to wind load (EN 12210)	Class C5	-
Racking (EN 14608)	n.a.	-
Torsion (EN 14609)	n.a.	-
Dangerous substances	n.a.	-

* Reference size 1m²

2.4 Placing on the market/ Application rules

For quality assurance purposes, windows and doors are regulated according to EN13249. and marked with a CE mark by the manufacturer. For the placing on the market the regulation (EU) No. 305/2011 and the performance characteristics EN 14351-1 apply.

2.5 Base materials / Ancillary materials

Raw material	Value	Unit
Wood	25,909	kg
Glass	17,404	kg
Steel	0,833	kg
Aluminium	2,047	kg
Plastics (TPE)	0,062	kg
Paint, impregnant, primer	2,286	kg
Argon	0,031	kg

2.6 Information on biogenic carbon content

Name	Value	Unit
Product	42,41	kg C
Packaging	1,92	kg C

2.7 Reference service life (RSL)

According the PCR B, no RSL must or can be indicated, since not all modules B1-B5 are declared.

2.8 Manufacture

The production phase (A3) consider the following processes: cutting of wood, preplanning, mould-ing and tapening, chiseling, wood frame impregnation, assembly of wood components, painting, assembly of glass and hardware, packaging. See also simplified process flowchart (figure 1).

2.9 Packaging

The door is wrapped in PE film and transported on wooden pallets.

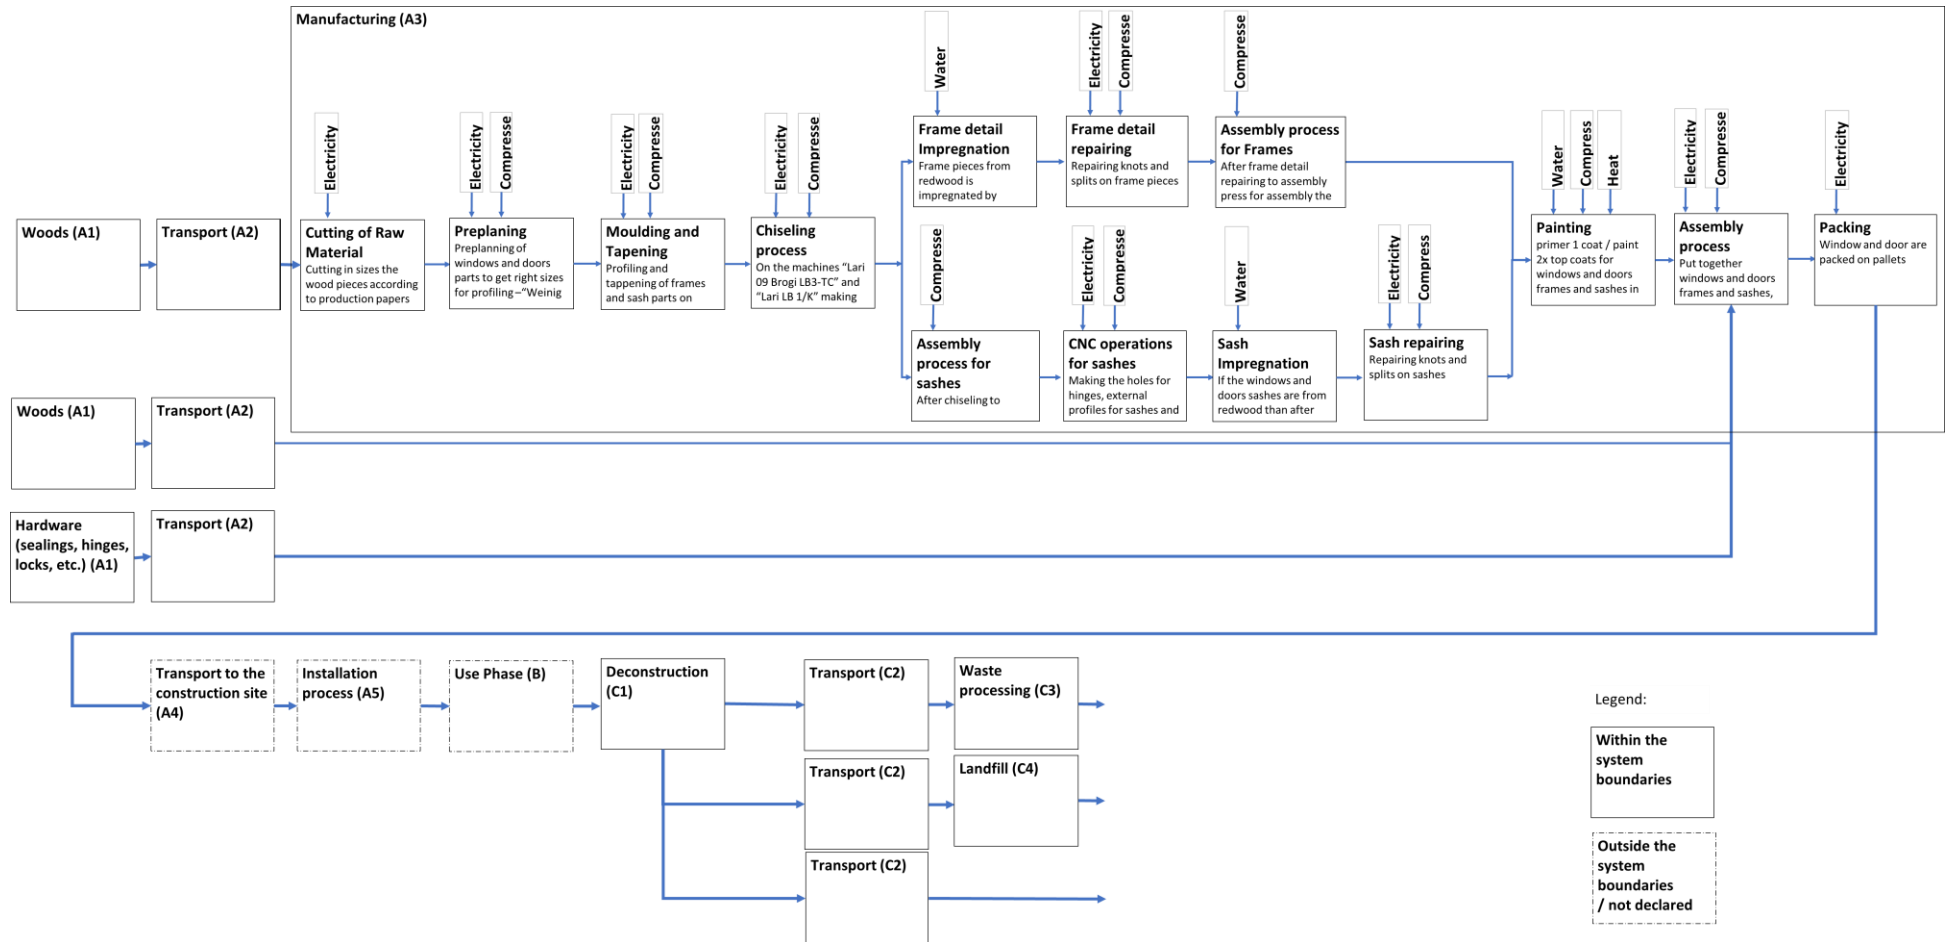

Figure 1: Simplified process flow chart of the manufacturing

3. LCA: Calculation rules

3.1 Declared unit

In accordance with PCR B (EN 17213), one square metre was chosen as the declared unit for this door. Further information for describing the declared unit be found in the tables below.

Description	Value	Unit
Declared unit	1	m ²
Frame: Material type	Redwood / Orgeno Pine (Douglas)	-
Frame: Mass	11,925 / 13,984	kg
Glass: Material type	Flat glass, Triple glazing	-
Glass: Mass	17,404	kg
Seal: Material type	TPE / PU / PP / PE	-
Seal: Mass	0,062	kg
Hardware: Material type	Steel / Aluminium	-
Hardware: Mass	0,620 / 2,481	kg
Total Mass	48,700	kg
Configuration	4-15-4-15-4	-
Gas type	Argon	-
Conversion factor to 1 kg	0,0205	m ² /kg

3.2 System boundary

This Life cycle assessment is made for EPD type "Cradle to gate with modules C1-C4 and module D": The Environmental Product Declaration analyses the production stage (A1-A3), the End-of-Life stage (C1-C4) and the benefits and loads beyond the system boundary (D).

The door manufacturing process, the individual components such as framing materials or profiles, hardware, glass, seals are delivered to the manufacturing site.

The processes that are performed at the manufacturing site are: Shaping of profiles, e.g. grinding of wooden profiles, cutting extruded profiles into size (aluminium, etc.), assemble profiles, treatment and coating of profiles and finally combining the infill and hardware with the profiles into a complete element. C1 concerns the removal of the door, whereby no environmental impact is assumed. The resulting waste materials and quantities are included in the respective modules.

3.3 Estimates and assumptions

All installed raw materials of the products were analysed and the masses were determined. Production-specific energy consumption were measured and provided by SIA BYKO-LAT. Supplier Information regarding the transport distances were provided by SIA BYKO-LAT.

The production waste wood, metal and paint and other mixed production waste are collected separately. For plastics and steel, 100 percent recycling is assumed and for general production waste 100 percent landfilling, as there is no waste incineration in Latvia. Wood waste is thermally recovered at the site. For production waste that cannot be clearly allocated (seals, glass), a raw material-related production reject of 5 percent was calculated. As the product is marketed internationally, no country-specific waste scenario can be considered. Therefore, the waste scenario of PCR B (Appendix B.3) was adopted. Removing the door or window does not result in any environmental impacts, so the value for module C1 is assumed to be zero.

3.4 Cut-off criteria

For process modules A1 to A3, all process-specific data was collected. All flows could be assigned potential environmental impacts through the Ecoinvent database. All flows that contribute more than 1 percent of the total mass, energy or environmental impact of the system have been included in the LCA. The sum of neglected processes does not exceed the 5 percent of total input mass for module A1-A3.

The following in- and outputs were neglected: Infrastructure of the manufacturing, production waste and municipal waste (except of wood, plastic, glass, waste water), lubricants and other ancillary materials.

3.5 Period under review

All process-specific data was collected for the operating year 2019.

3.6 Data quality

All process-specific data was collected for the 2019 operating year and is therefore up-to-date. The data is based on the annual average. In order to ensure comparability of the results, only consistent background data of the Ecoinvent database V3.5 was used in the LCA (e.g., records on energy, transportation, supplies and supplies), which refers to reference year 2018. The database is regularly reviewed and thus complies with the requirements of EN 15804 (background data not older than 10 years). All consistent datasets contained in the Ecoinvent database are documented and can be viewed in the online Ecoinvent documentation. The primary data were provided by SIA BYKO-LAT. The life cycle was modelled with the Nibe EPD App. Geographical reference space of the background data is Latvia. The overall representativeness and the precision for all datasets were determined with the Data Quality Ranking (DQR) formula, a ranking method based on the Product Environmental Footprint (PEF) approach.

3.7 Allocation

There are no co-products in the raw material supply phase, so no allocation methods were used at this stage. There are no allocations during the manufacturing phase at the plant.

3.8 Comparability

In principle, a comparison or evaluation of EPD data is only possible if all data sets to be compared have been created in accordance with EN 15804 and the building context or the product-specific performance characteristics have been taken into account.

4. LCA: Results

The following tables show the results of the impact assessment indicators, resource use, waste and other output streams. The results presented here refer to the declared average product.

Description of the system boundary																	
Product stage			Construction process stage		Use stage							End of life stage				Benefits and loads beyond the system boundaries

Disclaimer on ADP-e, ADP-f, WDP, ETP-fw, HTP-c, HTP-nc, SQP: The results of these environmental impact indicators must be used with caution, as the uncertainties in these results are high or as there is limited experience with the indicator.

Disclaimer on IR: This impact category mainly addresses the potential effect of low dose ionizing radiation on human health in the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents and occupational exposures, nor does it consider radioactive waste disposal in underground facilities. Potential ionizing radiation from soil, radon, and some building materials is also not measured by this indicator.

5. LCA: Interpretation

5.1 Indicators of impact assessment by impact category

The following figure shows the influence of the different life stages. As shown in figure below, the raw material (A1) and the manufacture (A3) have the greatest influence on the life cycle of BYKO-DA75. In a further dominance analysis, the following inputs could be identified as drivers of environmental impacts. Aluminium, glass, hardware. Potential credits come mainly from the material recovery of aluminium. From the graph shown above, it can be deduced that, in principle, the module raw material supply (A1) has the greatest influence on the life cycle assessment. For GWP biogenic, it is noticeable that the sum is negative. Theoretically, the value should be close to zero in total, since the biogenic carbon is released back into the atmosphere during incineration. This discrepancy is due to the fact that the data sets do not match optimally. While in the wood products a 2,97 CO₂ is stored by biomass build-up, in the combustion process only a CO₂ emission of 1,46 of kg wood is calculated. The packaging material (wooden pallets) also contributes with a negative input, while the CO₂ emission from combustion is not included, as this is assigned to the undeclared module A5.

Figure 2: Influence of the information modules on the main impact categories – BYKO-DA75

5.2 Information on data quality

The data quality can be classified as good overall. All relevant process-specific data could be collected in the operational data collection. Consistent data sets from the Ecoinvent database were available for almost all inputs and outputs. The background data meet the requirements of EN 15804, and the production data were recorded for the 2019 operating year. The quantities of raw materials and supplies used as well as energy consumption were recorded for the entire operating year. The life cycle assessment was carried out for all the product items listed. It can be assumed that the data for the declared average product are well representative.

Data quality was calculated using the Data Quality Rating method according to the PEF approach. The DQRs range from 1,75 to 2,0 for the most abundant inputs in terms of mass, and from 2,0 to 2,5 for smaller inputs. As noted in the interpretation (GWP biogenic), partial data sets are not entirely consistent with each other.
