

## Ecodesign tests for energy labelling

**Kiwa can perform tests according to the regulations for space heaters and combination heaters and water heaters and hot water storage tanks under the Ecodesign Directive (2009/125/EC) as written down in legislation L 239. Both the heating efficiency and the electrical consumption for heaters and the energy consumption for hot water production for water heaters can be tested.**

Relevant to manufacturers and suppliers of energy products.

Based on the test results the energy performance of heating products and hot water products can be determined (energy label A+++ to G).

Besides the sound power level and Nox emission can be tested as well.

The energy performance and sound power level can be indicated by labelling

The energy label for heating and hot water products is required from 26 September 2015. It is a great tool to assess at which class your products are at this moment. In the future, the energy label will be very important. Show your customers that you are prepared for the future and only offer the best.

You can ask for a quotation or information either by phone or e-mail. From there we support and guide you. We have all testing facilities in house. After approval of the quotation the test work starts. A test report will be sent to you by Kiwa when all the test work and the determination of the energy performance of the products have been performed successfully.
