

BRL-K768/03 External epoxy coatings of underground steel tanks, pipes & fittings

Coatings certified to the requirements of BRL-K768 are suitable for the external protection of underground steel tanks, pipes and fittings. Tanks protected with these coatings can be installed in areas with a high ground water table. Also, these coatings can be used in combination with a cathodic protection system.

For whom?

Owners of underground storage tanks. Also, this Evaluation Guideline is important for coating applicators certified to the requirements of Evaluation Guideline BRL-K790.

When is it necessary?

Owners of underground steel storage tanks are required to protect these tanks by means of an external coating. In areas with a high water table the tank installation needs to be protected against corrosion and quite often in combination with a cathodic protection system. The coating used in such instances is required to be able to cope with these severe conditions. Coatings complying with BRL-K768 meet these requirements.

Interested?

If you are interested in certification, please complete the application form. If you have any questions, please contact our sales office.

Note:

This Evaluation Guideline is only available in Dutch.
