

Inspection of Cranes and Lifting Devices

Inspection creates substantial data that can be used to ensure safety and increase the life span of a crane or a lifting device. The results serve as valuable input for the maintenance systems and provide early warnings of future problems so you can avoid costs or, at worst, an emergency breakdown. Inspection is more than complying with legislation and regulations. A well-trained inspector can immediately reveal when quality is not up to standard, and can thereby positively influence production and the quality of the product.

Kiwa Inspecta inspects all kinds of cranes and other lifting devices. We carry out inspections at every level, ranging from design review, installation, manufacturing, modernization, maintenance and in-service inspections. Many inspections are mandatory and require a formal record; others are commercially driven to meet specific customer needs.

We give you skilled and experienced staff, combined with practical procedures and clear-cut documentation. Integrity and respect for our partners are imperative for Kiwa Inspecta and we work very closely with our customers.

Benefits of Inspection of Cranes and Lifting Devices

- You minimize the risk of injury
- You increase operational availability
- You obtain a good basis for planning of maintenance and investment

Regulatory compliance

There are European directives to be fulfilled and, for control of devices in operation, there are a variety of national inspection requirements to be followed. Kiwa Inspecta is a notified body for many European directives. This means that Kiwa Inspecta is authorized by your national accreditation body to perform inspections in compliance with local and international standards.
