Policy studies

Constructing a new energy network is associated with significant costs. Consequently, the concept that is best suited to the situation should be identified as soon as possible. Various energy concepts can be compared on issues such as costs and CO2 emissions via energy studies.

Not only does this allow considered weighing-up of the different concepts, such as a natural gas or a heat energy network, the specific location of the pipelines can also be analysed.
The choices are important for policy-makers (central and local government), network operators and housing associations.

The energy studies provide important information when developing a new district or a new concept.
Initially, we collect together the required information and draw up a specific plan of action based on that information. The actual research itself takes place in the form of desk research or via computer models or test rigs in our fully equipped laboratory.
