

Plastics and rubbers are widely used in industrial applications. This can be as piping systems for chemicals, transport hoses, conveyor belts, tanks, membranes and a large number of other products. For all these products it goes that they need to be suitable for their application and that you have to be sure that you can rely on the well functioning.

You are...

Are you an engineer, a contractor or owner of various industrial installations and constructions, in which polymer materials are used? Then you know that it is important to avoid leakages or damages to your products. For instance glass reinforced pipes should not break due to high bending loads. Also leakages of seals can easily lead to high costing damage. For other parts it goes that after building they might not be able to be reached or replaced and therefore failure should be avoided completely. This can be during the design stage, an evaluation or application and use stage of industrial installations where polymer materials are involved. Different stages in buildings, at production sites, in utilities or energy plants. But also piping systems in industry for example.
