

Field Trials and Energy Monitoring

We conduct UK-wide energy monitoring projects.

Our energy monitoring services are often engaged by housing associations and local authorities.

One of the key factors is identifying an accurate baseline of “normal” energy usage and/or our typical CO₂ emissions. Often schemes kick-off using best guess figures only to realise that an accurate baseline is a prerequisite to subsequent reliable assessment of energy reduction measures.

Since standard emission factors relate energy consumption to CO₂ emissions, it pays (in more ways than one) to measure the amount of energy used as accurately as possible. Remember the old adage “You cannot control what you do not measure”.

We also offer:

- Energy audits
- ESOS audits
- Co-heating tests
- Environmental audits and particulate assessments
