

Technical Audits, Valuation and Due Diligence

The energy distribution sector is continually evolving. When taking control of networks, it is important to obtain insight into their technical condition. The quality of the assets being acquired is a determinant factor in their value.

In addition, technical audits of networks provide network operators with information about, for example, maintenance and replacement work they can expect to have to do in the short term.

Preparing for an intended network takeover entails accurately assessing its technical quality.

Target Groups

- Gas, CO₂, electricity, water and heating network operators
- Companies that wish to take over networks.
